

Wexford Trap

Materials	Bill of Sale	Tools
(7) panels	\$265.65 (\$37.95 per 4 X 4X 60 X 20')	driver
(20) posts	\$64.80 (\$4.05 per 6.5 ft post)	pliers
(50') slick wire	<u>\$9.90</u> (12.5 gauge - 10# - 340' / roll)	30' rope
(1) stabilizer	\$340.35	

The Wexford Trap is designed to trap feral hogs with no need for an intricate trap gate or trigger system. The hog is baited through the opening, while not being able to go back through because of the trap design. Assemble panels according to shape, place a t-post 3 feet from the end of the first panel, then another 3 feet, then one in the middle and one at the end. On the next panel, overlap 1 or 2 squares of the 4"X4" panel, then place another post in the middle and then again, one at the end. Use the slick wire to attach the post to the panels, placing a wire at the top middle and bottom for each t-post. The stabilizer can be made of anything. The idea here is to tie the two posts across from one another and not allow them to move in any direction. Place the seventh panel across the bottom end. This panel is later removed to load out what you trap. For bait, we recommend a plastic container with a small hole, loaded with corn, tied to a post with rope and swivels. The 4ft width at the bottom of the trap is for loading out. While loading prevent hogs from going under the trailer with boards!

You can call the Goliad County Extension Office (361.645.8204) for further instructions. Remember feral hogs are also called wild hogs for a reason! Use extreme caution while loading or checking trap.
